## 1. General

# 1.1. General and safety information

In this section, the term "Waspmote" encompasses both the Waspmote device itself and its modules and sensor boards.

- Read through the document "General Conditions of Libelium Sale and Use".
- Do not allow contact of metallic objects with the electronic part to avoid injuries and burns.
- · NEVER submerge the device in any liquid.
- Keep the device in a dry place and away from any liquid which may spill.
- Waspmote consists of highly sensitive electronics which is accessible to the exterior, handle with great care and avoid bangs or hard brushing against surfaces.
- Check the product specifications section for the maximum allowed power voltage and amperage range and consequently always use a current transformer and a battery which works within that range. Libelium is only responsible for the correct operation of the device with the batteries, power supplies and chargers which it supplies.
- Keep the device within the specified range of temperatures in the specifications section.
- Do not connect or power the device with damaged cables or batteries.
- Place the device in a place only accessible to maintenance personnel (a restricted area).
- Keep children away from the device in all circumstances.
- If there is an electrical failure, disconnect the main switch immediately and disconnect that battery or any other power supply that is being used.
- If using a car lighter as a power supply, be sure to respect the voltage and current data specified in the "Power Supplies" section.
- If using a battery in combination or not with a solar panel as a power supply, be sure to use the voltage and current data specified in the "Power supplies" section.
- If a software or hardware failure occurs, consult the Libelium Web <u>Development section</u>.
- Check that the frequency and power of the communication radio modules together with the integrated antennas are allowed in the area where you want to use the device.
- Waspmote is a device to be integrated in a casing so that it is protected from environmental conditions such as light, dust, humidity or sudden changes in temperature. The board supplied "as is" is not recommended for a final installation as the electronic components are open to the air and may be damaged.

## 1.2. Conditions of use

- Read the "General and Safety Information" section carefully and keep the manual for future consultation.
- Use Waspmote in accordance with the electrical specifications and the environment described in the "Electrical Data" section of this manual.
- Waspmote and its components and modules are supplied as electronic boards to be integrated within a final product. This
  product must contain an enclosure to protect it from dust, humidity and other environmental interactions. In the event of
  outside use, this enclosure must be rated at least IP-65.
- Do not place Waspmote in contact with metallic surfaces; they could cause short-circuits which will permanently damage it.

Further information you may need can be found at http://www.libelium.com/development/waspmote

The "General Conditions of Libelium Sale and Use" document can be found at: http://www.libelium.com/development/waspmote/technical\_service

# 2. Waspmote Plug & Sense!

The new Waspmote Plug & Sense! line allows you to easily deploy wireless sensor networks in an easy and scalable way ensuring minimum maintenance costs. The new platform consists of a robust waterproof enclosure with specific external sockets to connect the sensors, the solar panel, the antenna and even the USB cable in order to reprogram the node. It has been specially designed to be scalable, easy to deploy and maintain.

**Note:** For a complete reference guide download the "Waspmote Plug & Sense! Technical Guide" in the <u>Development section</u> of the **Libelium website**.

## 2.1. Features

- Robust waterproof IP65 enclosure
- · Add or change a sensor probe in seconds
- Solar powered with internal and external panel options
- Radios available: Zigbee, 802.15.4, Wifi, 868MHz, 900MHz and 3G/GPRS
- Over the air programming (OTAP) of multiple nodes at once
- · Special holders and brackets ready for installation in street lights and building fronts
- · Graphical and intuitive programming interface

## 2.2. Sensor Probes

Sensor probes can be easily attached by just screwing them into the bottom sockets. This allows you to add new sensing capabilities to existing networks just in minutes. In the same way, sensor probes may be easily replaced in order to ensure the lowest maintenance cost of the sensor network.

Figure 1: Connecting a sensor probe to Waspmote Plug & Sense!

-6- v4.1

# 2.3. Solar Powered

Battery can be recharged using the internal or external solar panel options.

The external solar panel is mounted on a 45° holder which ensures the maximum performance of each outdoor installation.

Figure 2: Waspmote Plug & Sense! powered by an external solar panel

For the internal option, the solar panel is embedded on the front of the enclosure, perfect for use where space is a major challenge.

Figure 3: Internal solar panel

-7- v4.1

Figure 4: Waspmote Plug & Sense! powered by an internal solar panel

# 2.4. Programming the Nodes

Waspmote Plug & Sense! can be reprogrammed in two ways:

The basic programming is done from the USB port. Just connect the USB to the specific external socket and then to the computer to upload the new firmware.

Figure 5: Programming a node

-8- v4.1

Over the Air Programming is also possible once the node has been installed. With this technique you can reprogram wirelessly one or more Waspmote sensor nodes at the same time by using a laptop and the Waspmote Gateway.

Figure 6: Typical OTAP process

# 2.5. Radio Interfaces

Model	Protocol	Frequency	txPower	Sensitivity	Range *
XBee-802.15.4-Pro	802.15.4	2.4GHz	100mW	-100dBm	7000m
XBee-ZB-Pro	ZigBee-Pro	2.4GHz	50mW	-102dBm	7000m

# 2.6. Program in minutes

In order to program the nodes an intuitive graphic interface has been developed. Developers just need to fill a web form in order to obtain the complete source code for the sensor nodes. This means the complete program for an specific application can be generated just in minutes. Check the Code Generator to see how easy it is at:

http://www.libelium.com/development/plug\_&\_sense/sdk\_and\_applications/code\_generator

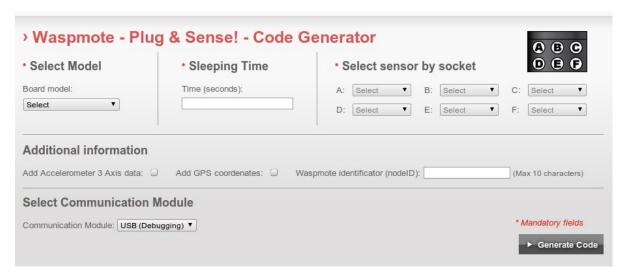

Figure 7: Code Generator

## 2.7. Data to the Cloud

The Sensor data gathered by the Waspmote Plug & Sense! nodes is sent to the Cloud by <u>Meshlium</u>, the Gateway router specially designed to connect Waspmote sensor networks to the Internet via Ethernet, Wifi and 3G interfaces.

Thanks to Meshlium's new feature, the Sensor Parser, now it is easier to receive any frame, parse it and store the data into a local or external Data Base.

## **2.10. Models**

There are some defined configurations of Waspmote Plug & Sense! depending on which sensors are going to be used. Waspmote Plug & Sense! configurations allow to connect up to six sensor probes at the same time.

Each model takes a different conditioning circuit to enable the sensor integration. For this reason each model allows to connect just its specific sensors.

This section describes each model configuration in detail, showing the sensors which can be used in each case and how to connect them to Waspmote. In many cases, the sensor sockets accept the connection of more than one sensor probe. See the compatibility table for each model configuration to choose the best probe combination for the application.

It is very important to remark that each socket is designed only for one specific sensor, so **they are not interchangeable**. Always be sure you connected probes in the right socket, otherwise they can be damaged.

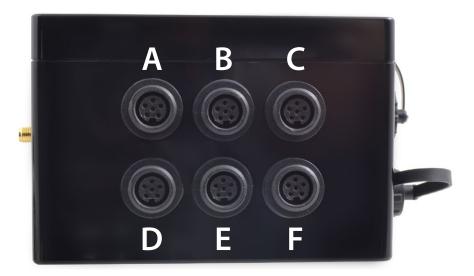

Figure 11: Identification of sensor sockets

### 2.10.1. Smart Enviroment

Smart Environment model is designed to monitor environmental parameters such as temperature, humidity, atmospheric pressure and some types of gases. The main applications for this Waspmote Plug & Sense! configuration are city pollution measurement, emissions from farms and hatcheries, control of chemical and industrial processes, forest fires, etc. Go to the application section in the **Libelium website** for a complete list of services.

-13-

Figure 12: Smart Environment Waspmote Plug & Sense! model

Sensor sockets are configured as shown in the figure below.

Sensor	Sensor probes allowed for each sensor socket			
Socket	Parameter	Reference		
A	Temperature	9203		
	Carbon monoxide - CO	9229		
	Methane - CH <sub>4</sub>	9232		
	Ammonia – NH <sub>3</sub>	9233		
	Liquefied Petroleum Gases: H <sub>2</sub> , CH <sub>4</sub> , ethanol, isobutene.	9234		
	Air pollutants 1: C <sub>4</sub> H <sub>10</sub> , CH <sub>3</sub> CH <sub>2</sub> OH, H <sub>2</sub> , CO, CH <sub>4</sub>	9235		
	Air pollutants 2: C <sub>6</sub> H <sub>5</sub> CH <sub>3</sub> , H <sub>2</sub> S, CH <sub>3</sub> CH <sub>2</sub> OH, NH <sub>3</sub> , H <sub>2</sub>	9236		
	Alcohol derivates: $CH_3CH_2OH$ , $H_2$ , $C_4H_{10}$ , $CO$ , $CH_4$	9237		
В	Humidity	9204		
	Atmospheric pressure	9250		
С	Carbon dioxide - CO <sub>2</sub>	9230		
D	Nitrogen dioxide - NO <sub>2</sub>	9238		
	Ozone - O <sub>3</sub>	9258		
Е	Hydrocarbons - VOC	9201		
	Oxygen - O <sub>2</sub>	9231		
F	Carbon monoxide - CO	9229		
	Methane - CH <sub>4</sub>	9232		
	Ammonia – NH <sub>3</sub>	9233		
	Liquefied Petroleum Gases: H <sub>2</sub> , CH <sub>4</sub> , ethanol, isobutene.	9234		
	Air pollutants 1: C <sub>4</sub> H <sub>10</sub> , CH <sub>3</sub> CH <sub>2</sub> OH, H <sub>2</sub> , CO, CH <sub>4</sub>	9235		
	Air pollutants 2: C <sub>6</sub> H <sub>5</sub> CH <sub>3</sub> , H <sub>2</sub> S, CH <sub>3</sub> CH <sub>2</sub> OH, NH <sub>3</sub> , H <sub>2</sub>	9236		
	Alcohol derivates: CH <sub>3</sub> CH <sub>2</sub> OH, H <sub>2</sub> , C <sub>4</sub> H <sub>10</sub> , CO, CH <sub>4</sub>	9237

**Note:** For more technical information about each sensor probe go to the **<u>Development section</u>** in Libelium website.

-14-

## 3. Hardware

# 3.1. General Description

The Waspmote Gases 2.0 board has been designed to monitor environmental parameters such as temperature, humidity, atmospheric pressure and 14 different types of gases. It allows the inclusion of 7 gases sensors at the same time, the regulation of their power through a system of solid state switches and the amplification of the output signal of each one of them through a non-inverting amplification stage of a maximum gain of 101 controlled by a digital potentiometer configurable through the Inter-Integrated Circuit Bus, I2C).

The gases which can be monitored are:

- Carbon Monoxide CO
- Carbon Dioxide CO<sub>2</sub>
- Molecular Oxygen O<sub>2</sub>
- Methane CH<sub>4</sub>
- Molecular Hydrogen H<sub>2</sub>
- Ammonia NH<sub>3</sub>
- Isobutane C₄H₁₀
- Ethanol CH<sub>3</sub>CH<sub>2</sub>OH
- Toluene C<sub>6</sub>H<sub>5</sub>CH<sub>3</sub>
- Hydrogen Sulphide H<sub>2</sub>S
- Nitrogen Dioxide NO<sub>2</sub>
- Ozone O<sub>3</sub>
- Volatile Organic Compounds (VOC's)
- Hydrocarbons

# 3.2. Specifications

Weight: 20gr

**Dimensions:** 73.5 x 51 x 1.3 mm **Temperature Range:** [-20°C, 65°C]

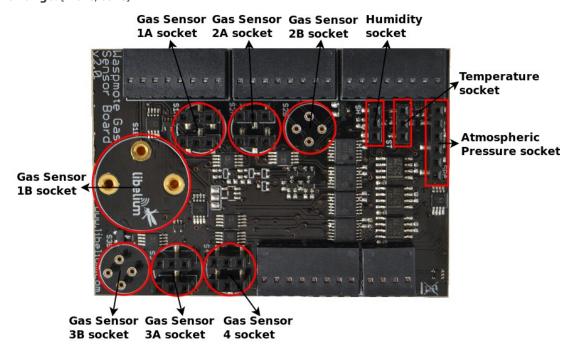

Figure 14: Upper side

-15- v4.1

#### Sensors compatibility:

- There is a dedicated socket for each of the following sensors:
  - temperature
  - humidity
  - air pressure
  - CO<sub>2</sub> (socket 1A)
  - O<sub>2</sub> (socket 1B)
  - NO<sub>2</sub> (socket 3B)
  - O<sub>3</sub> or VOC (socket 2B)
- Sockets 2A, 3 and 4 are available for the rest of the sensors.
- CO and NH<sub>3</sub> sensors can only be placed in the sockets 3 or 4.

# 3.3. Electrical Characteristics

**Board power voltage:** 3.3V and 5V

Sensor power voltage: 5V

Maximum admitted current (continuous): 200mA Maximum admitted current (peak): 400mA

## 4. Sensors

## 4.1. General considerations in the use of the sensors

A very similar structure has been installed for all the connectors for the gas sensors: a load resistance at the output of each sensor, except in connectors 1A and 1B where it is not necessary, combined with an amplification stage of maximum gain 101. Connectors 1A and 1B, 2A and 2B and 3A and 3B share the same amplification stage and the same output to the microprocessor. For more details on the connectors, see the Design and connections section in this manual.

The choice of amplification stage gain and of the sensor's load resistance can be carried out according to two parameters: the specific sensor available, since there may be significant variations between two different sensors of the same model, and the value and range of concentrations of gas to be monitored.

**Important:** when selecting load resistance and amplification it must be remembered that, although the sensors must be powered by a voltage of 5V to function appropriately, the Waspmote allows input between 0 and 3.3V, so it will be necessary to calculate the resistance, load and gain values to adapt the measurement range of the sensor to the Waspmote input.

The amplification stage gain and load resistance of a connector can be configured through a simple group of commands available in the SensorGasv20 library, created to facilitate handling of the board from the Waspmote mote. For more information on the library instructions and steps to follow for the configuration of the sensors, consult the API section of this manual.

The accuracy which can be obtained in the sensor's output value will be dependent on the way in which it is supplied. This way, the longer the power time or duty cycle, as appropriate, the better accuracy will be obtained. The disadvantage of prolonged power is an increase in the mote's consumption, with the consequent decrease of the battery's life, so adjusting the power of each sensor to the requirements of the specific application being developed is recommended to optimize the equipment's performance.

The calculation of the sensor's resistance, from which the concentration of gas value can be obtained using the graphs included in this manual and in the sensors' data sheets, can be made using the following equation:

$$R_s = (V_c x R_l) / V_{out} - R_l$$

In which  $R_s$  is the sensor's output resistance,  $V_c$  its power (5V for any sensor except socket 3B for the  $NO_2$ , which is powered at 1.8V, and socket 2B for VOC and  $O_3$  sensors, which is powered at 2.5V),  $V_{OUT}$  is the output voltage measurement and  $R_I$  the load resistance which has been defined.

When a sensor remains without power for a prolonged period it is possible that it shows an unstable output.

This stability is regained after spending time switched on or after many consecutive cycles of power supply.

Sensitivity of the sensor may vary when the device is subjected to large variations in temperature or humidity, for example in outdoor conditions. To compensate for these variations, use the tables and graphs used in the sensors' data sheets.

-17- v4.1

# 4.2. Starting with the gas sensors

In this section we are going to explain the first steps to start with the sensors used in the Gases 2.0 Board, including the most common doubts, such as what parameters configure for the adaptation stage, which calibration process must be followed or how to transform the read voltage or resistance value into a concentration.

Take into account that developing a robust application for gases detection or measurement may take an important effort of testing and knowing the sensors.

#### 4.2.1. Sensor calibration

When dealing with most of the sensors used in the Gases 2.0 board it is highly recommended to calibrate the sensor in order to get an accurate value, since, as explained in section "General considerations in the use of the sensors", its normal resistance and sensitivity may vary from one unit to another in a wide range. This calibration may not be necessary in all applications, for example if the sensor is going to be used in a gas detection, where monitoring the variation of the sensor output may be enough to have it working properly, and the normal operation conditions may be replicated without an specific equipment.

The calibration procedure requires the capture of the sensor response under different concentrations of gas in the target operation range (that should be comprised in the operation range of the sensor), and, depending on the conditions of the application to be implemented, under controlled temperature and humidity. The larger the number of calibration points in that range the more accurate the calibration will be, a logarithmic approximation to the response of the sensor for the intermediate values should be applied (in one or two axis, depending on the sensors, as shown in their respective response graphs). Take into account that gas sensors are sensitive, in different degree, to several target gases, which may affect the measurement both in the field and in the laboratory. The recreation of these conditions may require of specific equipment, so it may be necessary the help of a specialized laboratory.

## 4.2.2. Gain and load resistor configuration

The gain and load resistor configured for a given stage will depend on two main aspects: first of all, the sensor connected to the stage. Since in most cases there is a high variability in the parameters that rule the behavior of the sensor (sensor's initial resistance and sensitivity, taking this as the variability of the sensor resistance with the gas concentration), every single unit may show important differences in operation, so it will be necessary a specific configuration for each one. Secondly, the application conditions under which the sensor is supposed to be operating will also have to be taken into account, in order to maintain the output voltage of the adaptation stage in the voltage range of the input of the mote's microcontroller (between 0 and 3.3V). It will also be recommended to set both parameters to have an output voltage of around 1.6V (the middle of the voltage input range) when the gas concentration is in the middle of the desired operation range.

The most adequate way of configuring the adaptation stage is by determining the load resistance and gain necessary from the calibration data and the application requirements and test it, adjusting the definitive values with the results obtained. In other cases, in which these parameters cannot be that clearly defined owing to the lack of calibration or to the indeterminacy of the application conditions, for example when handling the sensors for the first time, you can follow the advice provided below:

As a general rule, gain will be fixed at 1 in almost every application, only in very specific situations, such as operation in the limits of the sensor range, it will be necessary a different value. There are two exceptions to this rule, that are sensors for  $CO_2$  (TGS4161) and  $O_2$  (SK-25) which output a voltage that has to be amplified to adjust it to the Waspmote's analog-to-digital converter. In the case of the  $O_2$  sensor the extremely low voltage advises a gain of 100, whilst for the  $CO_2$  sensor, with a higher (and more variable) output, a gain between 7 and 10 will be adequate.

In the case of the load resistor it is not that simple, since, as said before, it will be different from one sensor to another. If calibration has not been performed it will be necessary a wide testing based on trial and error to achieve the correct resistance value. It is recommended in this case to start with the lowest value indicated as initial sensor resistance in the documentation, and adjust it to get the desired output voltage (usually 1.6V, the middle of the analog-to-digital converter range, if it is not specified by another restriction). When carrying out this adjustment beware not to configure a resistance below the minimum load resistance indicated in the corresponding section of the documentation, since it could damage the sensor.

As indicated in section "General considerations in the use of the sensors", beware when operating with sensors that have not been used for a long time, since they may require of some time to get to work properly. Applying a "burning" process, having them on with a continuous reading for at least about 12 hours, is highly recommended before starting using the sensors.

-18-

## 4.2.3. Converting the read data

The gas concentration value in ppm or ppb, depending on the sensor, can be obtained from the ratio between the read resistance of the sensor (that can be obtained using function calculateResistance, described in section "API", or by direct calculation) and the initial resistance of the sensor, except in the case of the  $O_2$  (SK-25) and  $O_2$  (TGS4161), which as said before output a voltage proportional to the gas concentration.

Again, the most accurate response will be obtained if sensors are calibrated previously to their introduction in the definitive application. Constructing a conversion function or graph out of the calibration results and translating the read values into it will lead to the best performance.

In case the calibration process cannot be performed, the concentration may be estimated using the provided output graphs, which correspond to the typical response of the sensors. Even though, it will be necessary to calculate the initial resistance of the sensor, whose range is given in the specifications section of the sensor. In some cases it may be determined from a normal environment measurement, since information may be obtained from other sources such as detectors or studies about the gas presence in the operation environment. Anyway, take into account that the data obtained following this method will be highly inaccurate.

Finally, it is necessary to keep in mind that in the case of some sensors and applications the extraction of the concentration value may not be that straightforward, since other parameters may interfere in the behavior of the sensor. In some sensors other gases different from the target can cause a significant change in the resistance value, so it will be necessary a high knowledge of the application conditions to be able to determine precisely the gas concentration. The combination of several sensors is a suitable option to avoid this situations. Also, in applications in which high variations of temperature and humidity are present it may be required to perform a compensation. For this, a temperature and a humidity sensor have been integrated in the Gases Sensor boards, so all the necessary information can be obtained. Please refer to the sensors data sheet and application notes for more information about the temperature and humidity compensation of the sensors.

# 4.3. Humidity Sensor – 808H5V5

## 4.3.1. Specifications

Measurement range: 0 ~ 100%RH Output signal: 0.8 ~ 3.9V (25°C)

**Accuracy:** <±4%RH (at 25°C, range 30 ~ 80%), <±6%RH (range 0 ~ 100)

**Supply voltage:** 5V DC ±5%

Operating temperature:  $-40 \sim +85$  °C

**Response time:** <15 seconds **Typical consumption:** 0.38mA **Maximum consumption:** 0.5mA

Figure 15: Image of the 808H5V5 sensor

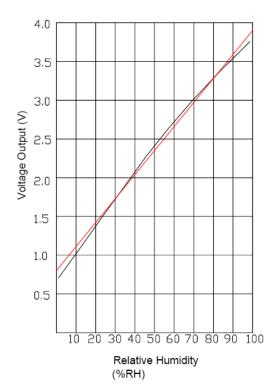

#### 4.3.2. Measurement Process

This is an analog sensor which provides a voltage output proportional to the relative humidity in the atmosphere. As the sensor's signal range is outside of that permitted to the Waspmote's input, a voltage divider has been installed which converts the output voltage to values between 0.48 ~ 2.34V.

The sensor remains powered provided that the board's 5V supply is switched on, so that for its reading it is only necessary to execute the capture command of the analog value of the pin to which the sensor is connected (ANALOG4).

Reading code:

```
{
   SensorGasv20.0N();
   delay(15000);
   float value;
   value = SensorGasv20.readValue(SENS_HUMIDITY);
}
```

Temperature:25°C

Power

Supply:5.00∨ DC

Figure 16: 808H5V5 Humidity sensor output taken from the Sencera Co. Ltd sensor data sheet

You can find a complete example code for reading the humidity sensor in the following link:

http://www.libelium.com/development/waspmote/examples/ga-2-humidity-sensor-reading

-20- v4.1

This sensor has its own connector on the Waspmote Gases 2.0 board:

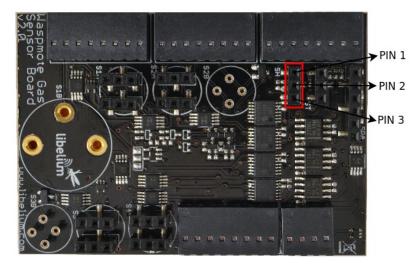

Figure 17: Image of the sensor connector on the Waspmote Gases 2.0 board

# 4.4. Temperature Sensor – MCP9700A

## 4.4.1. Specifications

**Measurement range:** [-40°C ,+125°C]

Output voltage (0°C): 500mV

Sensitivity: 10mV/°C

**Accuracy:**  $\pm 2$ °C (range 0°C ~ +70°C),  $\pm 4$ °C (range -40 ~ +125°C)

**Supply voltage:** 2.3 ~ 5.5V

**Response time:** 1.65 seconds (63% response from +30 to +125°C).

**Typical consumption:** 6μA **Maximum consumption:** 12μA

Figure 18: Image of the MCP9700A temperature sensor

#### 4.4.2. Measurement Process

The MCP9700A is an analog sensor which converts a temperature value into a proportional analog voltage. The range of output voltages is between 100mV (-40°) and 1.75V (125°C), resulting in a variation of 10mV/°C, with 500mV of output for 0°C.

The output can thus be read directly from Waspmote through the capture command of the pin's analog value to which it is connected (ANALOG1).

Reading code:

```
{
   SensorGasv20.0N();
   delay(100);
   float value;
   value = SensorGasv20.readValue(SENS_TEMPERATURE);
}
```

-21- v4.1

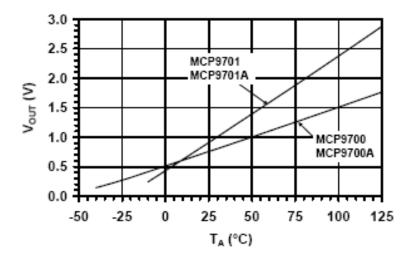

Figure 19: Graph of the MCP9700A sensor output voltage with respect to temperature, taken from the Microchip sensor's data sheet

This sensor has its own connector on the Waspmote Gases 2.0 board:

You can find a complete example code for reading the temperature sensor in the following link:

http://www.libelium.com/development/waspmote/examples/ga-1-temperature-sensor-reading

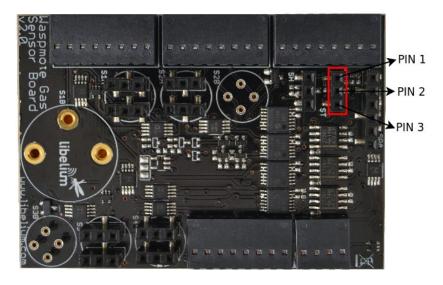

Figure 20: Image of the temperature sensor connector of the Waspmote Gases 2.0 board

# 4.5. Atmospheric Pressure Sensor - MPX4115A

# 4.5.1. Specifications

Measurement range:  $15 \sim 115$ kPa Output signal:  $0.2 \sim 4.8$ V ( $0 \sim 85$ °C)

Sensitivity: 46mV/kPa Accuracy: <±1,5%V (0 ~ 85°C) Typical consumption: 7mA Maximum consumption: 10mA Supply voltage: 4.85 ~ 5.35V

Operation temperature:  $-40 \sim +125$ °C Storage temperature:  $-40 \sim +125$ °C

Response time: 20ms

Figure 21: MPX4115A Sensor

-22- v4.1

#### 4.5.2. Measurement Process

The MPX4115A sensor converts atmospheric pressure to an analog voltage value in a range covering between 0.2V and 4.8V. As this is a range which exceeds the maximum value admitted by Waspmote, its output has been adapted to fit in a range between 0.12V and 2.88V.

To read the sensor it is sufficient to capture the analog value in its input (ANALOG5) via the corresponding command.

Reading Code:

```
{
   SensorGasv20.0N();
   SensorGasv20.setSensorMode(SENS_ON, SENS_PRESSURE);
   delay(30);
   float value;
   value = SensorGasv20.readValue(SENS_PRESSURE);
}
```

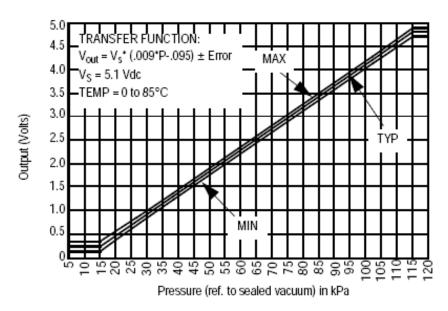

Figure 22: Graph of the MPX4115A sensor's output voltage with regard to pressure taken from the Freescale sensor's data sheet

You can find a complete example code for reading the atmospheric pressure sensor in the following link:

http://www.libelium.com/development/waspmote/examples/ga-3-atmospheric-pressure-sensor-reading

This sensor has its own connector on the Waspmote Gases 2.0 board:

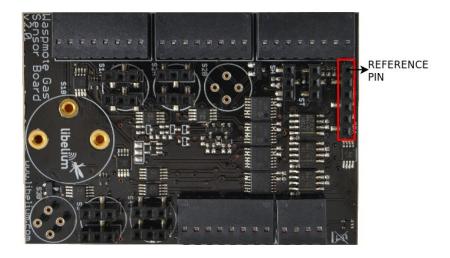

Figure 23: Image of the socket for the MPX4115A sensor

-23- v4.1

# 4.6. Carbon Monoxide (CO) Sensor – TGS2442

## 4.6.1. Specifications

Gases: CO

Measurement range:  $30 \sim 1000 ppm$ Resistance at 100ppm:  $13.3 \sim 133 k\Omega$ 

**Sensitivity:** 0.13 ~ 0.31 (ratio between the resistance at 300ppm and at 100ppm)

Supply voltage: 5V ±0.2V DC

Operating temperature: -10 ~ +50°C

**Response time:** 1 second **Minimum load resistance:**  $10k\Omega$ 

Average consumption: 3mA (throughout the complete power supply cycle in one second)

Figure 24: Image of the TGS2442 sensor

#### 4.6.2. Measurement Process

The TGS2442 is a resistive sensor sensitive to the changes in concentration of Carbon Monoxide (CO) and, very slightly, Hydrogen  $(H_2)$ , which may be placed in the board's socket 3A and 4, and must be connected in the way indicated in images 51 and 53 of sections "Connector 3" and "Connector 4" about these two connectors. The sensor's resistance would vary according to the graph in figure 25, which may present significant variations between two different sensors, so it is recommended to consult the sensor's documentation to choose the load resistance and amplification gain and calibrate it before finally inserting it into the application.

Reading this sensor requires a cycle of one second throughout which two power supply pulses are generated on heat resistance and sensor resistance of 14ms and 5ms each (average consumption throughout the power supply cycle is 3mA). The execution of this cycle and the reading of the sensor can be done automatically using the functions of the SensorGasv20 library.

Reading code:

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENSOR, GAIN, RESISTOR);
   float value;
   value = SensorGasv20.readValue(SENSOR);
}
```

SENSOR indicates the socket into which it is to be inserted, for this sensor: SENS\_SOCKET3CO or SENS\_SOCKET4CO GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance to be introduced

You can find a complete example code for reading the TGS2442 sensor placed on socket 4 in the following link:

http://www.libelium.com/development/waspmote/examples/ga-11-co-sensor-on-socket4-reading

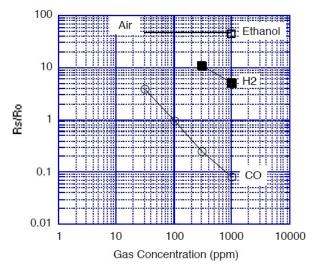

Figure 25: Graph of the sensitivity of the TGS2442 taken from the Figaro sensor's data sheet

-24- v4.1

# 4.7. Carbon Dioxide (CO<sub>2</sub>) Sensor – TGS4161

## 4.7.1. Specifications

Gases: CO<sub>2</sub>

**Measurement range:** 350 ~ 10000ppm **Voltage at 350ppm:** 220 ~ 490mV

Sensitivity: 44 ~ 72mV (variation between the voltage at 350ppm and at 3500ppm)

Supply voltage:  $5V \pm 0.2V DC$ Operating temperature:  $-10 \sim +50 \degree C$ 

**Response time:** 1.5 minutes **Average consumption:** 50mA

Figure 26: Image of the TGS4161 sensor

#### 4.7.2. Measurement Process

The TGS4161 sensor provides a voltage output proportional to the  $CO_2$  concentration in the atmosphere. It shows a value between 220 and 490mV for a concentration of 350ppm (approximately the normal  $CO_2$  concentration in the air) decreasing as the amount of gas increases. Different sensors may show a large variability in the initial voltage values at 350ppm and sensitivity, so it is recommended to calibrate each sensor before including it in the application.

The accuracy that this sensor can offer will vary depending on the time it has remained powered before being measured. A time of 30 seconds is sufficient to detect significant changes in concentration, while a high accuracy measurement will require at least 10 minutes of power.

This sensor must be placed only in connector 1A as indicated in figure 48 which appears in section "Connector 1". To access the sensor's output value it is enough to execute the SensorGasv20 library command which captures the sensor's analog value in its input pin (ANALOG3).

Reading code:

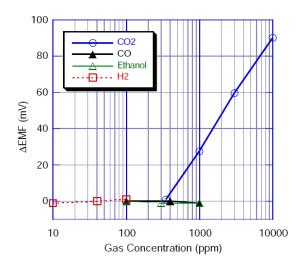

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENS_CO2, GAIN);
   SensorGasv20.setSensorMode(SENS_ON, SENS_CO2);
   delay(TIME);
   float value;
   value = SensorGasv20.readValue(SENS_CO2);
}
```

GAIN indicates the chosen gain for the sensor.

TIME is the time in milliseconds that the sensor remains on before taking the measurement (minimum: 30000)

You can find a complete example code for reading the TGS4161 sensor in the following link:

#### http://www.libelium.com/development/waspmote/examples/ga-4-co2-sensor-reading

-25-

Figure 27: Graph of sensitivity of the TGS4161 sensor taken from the Figaro sensor's data sheet

v4.1

# 4.8. Molecular Oxygen (O<sub>2</sub>) Sensor – SK-25

## 4.8.1. Specifications

Gases: O<sub>2</sub>

**Measurement range:** 0 ~ 30%

Output range: Approximately 0 ~ 10mV

Initial voltage: 5.5 ~ 8.8mV

**Operating temperature:**  $5 \sim +40$ °C

**Response time:** 15 seconds

Consumption: 0µA

Figure 28: Image of the SK-25 sensor

#### 4.8.2. Measurement Process

The SK-25 is an analog sensor which provides a voltage output proportional to the  $\rm O_2$  concentration in the atmosphere, without needing power and therefore with zero consumption. It shows an output range between 0 and 10mV, with voltage in standard conditions (approximately 21%  $\rm O_2$  concentration) of between 5.5 and 8.8mV. The output response can vary from one sensor to another, so it is recommended to calibrate the sensor before finally inserting it into the application.

Reading code:

```
{
   SensorGasv20.0N();
   delay(10);
   SensorGasv20.configureSensor(SENS_02, GAIN);
   float value;
   value = SensorGasv20.readValue(SENS_02);
}
```

GAIN indicates the chosen gain for the sensor.

You can find a complete example code for reading the SK25 sensor in the following link:

#### http://www.libelium.com/development/waspmote/examples/ga-5-o2-sensor-reading

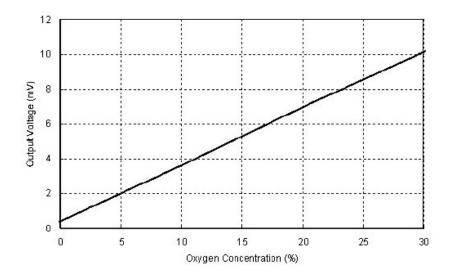

Figure 29: Graph of the sensitivity of the SK-25 extracted from the Figaro sensor's data sheet

-26- v4.1

# 4.9. Nitrogen Dioxide (NO<sub>2</sub>) Sensor - MiCS-2710

## 4.9.1. Specifications

Gases: NO<sub>2</sub>

Measurement range:  $0.05 \sim 5ppm$ Air resistance:  $0.8 \sim 8k\Omega$  (typically  $2.2k\Omega$ )

**Sensitivity:** 6 ~ 100 (typically 55, ratio between the resistance at 0.25ppm and in air)

Supply voltage:  $1.7 \sim 2.5 \text{V DC}$ Operating temperature:  $-30 \sim +85 ^{\circ}\text{C}$ 

Response time: 30 seconds

Average consumption: 26mA (throughout the complete power supply cycle in one second)

Figure 30: Image of the MiCS-2710 sensor

#### 4.9.2. Measurement Process

The MiCS-2710 is a sensor whose resistance varies in the presence of small concentrations of  $NO_2$ . This value varies between  $2k\Omega$  and  $2M\Omega$  approximately, providing high accuracy throughout the output range. Unlike the rest of the board's gas sensors, which operate at a voltage of 5V, this sensor is powered through a 1.8V voltage regulator, with consumption of approximately 26mA. The sensor's resistance in air, as well as its sensitivity, can vary between different units, so it is recommended to calibrate each one of them before finally inserting them in the application.

This sensor must be connected in socket 3B of the board (its position is indicated in section "Connector 3"), and its output can be read through the capture commands of the SensorGasv20 library.

Reading code:

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENS_SOCKET3B, GAIN, RESISTOR);
   SensorGasv20.setSensorMode(SENS_ON, SENS_SOCKET3B);
   delay(TIME);
   float value;
   value = SensorGasv20.readValue(SENS_SOCKET3B);
}
```

GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for the sensor

TIME is the time in milliseconds that the sensor remains on before taking the measurement (minimum: 30000)

You can find a complete example code for reading the MiCS-2710 sensor in the following link:

#### http://www.libelium.com/development/waspmote/examples/ga-9-socket3b-sensor-reading

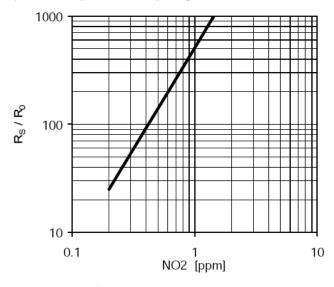

Figure 31: Graph of the sensitivity of the MiCS-2710 taken from the e2v's sensor data

-27- v4.1

# 4.10. Ammonia (NH<sub>3</sub>) sensor – TGS2444

## 4.10.1. Specifications

Gases: NH<sub>3</sub>, H<sub>2</sub>S

Measurement range:  $10 \sim 100 ppm$ Resistance at 10ppm:  $3.63 \sim 36.3 k\Omega$ 

Sensitivity: 0,063 ~ 0.63 (ratio between the resistance at 3000 and at 1000ppm)

Supply voltage: 5V  $\pm 0.2$ V DC Operating temperature: -10  $\sim$  +50°C

Response time: 250 msMinimum load resistance:  $8k\Omega$ 

**Average consumption:** 12mA (throughout the complete power supply cycle in 250ms)

Figure 32: Image of the TGS2444 sensor

#### 4.10.2. Measurement Process

The TGS2444 sensor is a resistive sensor which is highly sensitive to variations in the concentration of Ammonia ( $NH_3$ ) and which shows slight sensitivity to hydrogen sulphide ( $H_2S$ ) and to a lesser extent, to Hydrogen ( $H_2$ ) and Ethanol ( $CH_3CH_2OH$ ). Both the sensor's initial resistance (at 10ppm) and its sensitivity vary widely between different sensors of the same model, so it is recommended to calibrate each one of them independently before finally including them in the application.

This sensor can be placed on connectors 3A and 4 following the direction indicated in sections "Connector 3" and "Connector 4". To read it, the necessary instructions are in the SensorGasv20 library:

Reading code:

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENSOR, GAIN, RESISTOR);
   float value;
   value = SensorGasv20.readValue(SENSOR);
}
```

SENSOR indicates the socket into which it is to be inserted, for this sensor: SENS\_SOCKET3NH3 or SENS\_SOCKET4NH3 GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for the sensor

You can find a complete example code for reading the TGS2444 sensor placed on socket 3 in the following link:

#### http://www.libelium.com/development/waspmote/examples/ga-12-nh3-sensor-on-socket3-reading

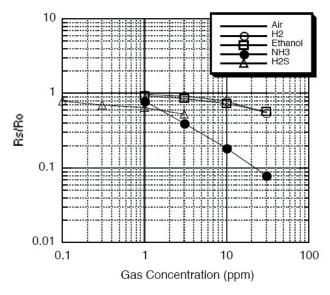

Figure 33: Graph of the sensitivity of the TGS2444 taken from the Figaro sensor data sheet

-28- v4.1

# 4.11. Methane (CH<sub>4</sub>) sensor – TGS2611

## 4.11.1. Specifications

Gases: CH<sub>4</sub>, H<sub>2</sub>

Measurement range:  $500 \sim 10000 ppm$ Resistance at 5000ppm:  $0.68 \sim 6.8 k\Omega$ 

**Sensitivity:**  $0.6 \pm 0.06$  (ratio between the resistance at 9000 and at 3000ppm)

**Supply voltage:** 5V ±0.2V DC

Operating temperature:  $-10 \sim +40$ °C

Response time: 30 seconds
Minimum load resistance: 0.45kΩ
Average consumption: 61mA

Figure 34: Image of the TGS2611 sensor

#### 4.11.2. Measurement Process

The TGS2611 sensor shows a variable resistance with the concentration of  $CH_4$  and to a lesser extent with the concentration of  $H_2$ . The sensor's initial resistance (for 5000ppm) and its sensitivity may show large variations between different sensors of the same model, so it is recommended to consult the manufacturer's documentation and calibrate it before finally inserting it in the application.

This sensor can be used from connectors 2A, 3A and 4, placing it in the position referred to in sections "Connector 2", "Connector 3" and "Connector 4" and its output value can be read using the corresponding function in the SensorGasv20 library:

Reading code:

```
{
    SensorGasv20.0N();
    SensorGasv20.configureSensor(SENSOR, GAIN, RESISTOR);
    SensorGasv20.setSensorMode(SENS_ON, SENSOR);
    delay(TIME);
    float value;
    value = SensorGasv20.readValue(SENSOR);
}
```

SENSOR indicates the socket into which it is to be inserted, for this sensor:

SENS SOCKET2A, SENS SOCKET3A or SENS SOCKET4A

GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for the sensor

TIME is the time in milliseconds that the sensor remains switched on before taking the measurement (minimum: 30000)

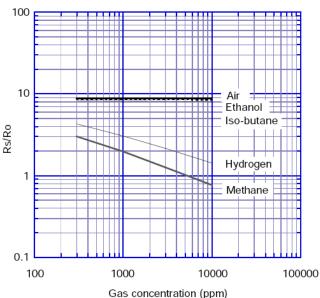

Figure 35: Graph of sensitivity of the TGS2611 taken from the Figaro sensor's data sheet

-29- v4.1

# 4.12. Liquefied Petroleum Gas Sensor - TGS2610

## 4.12.1. Specifications

**Gases:**  $CH_3CH_2OH$ ,  $CH_4$ ,  $C_4H_{10}$ ,  $H_2$ **Measurement range:**  $500 \sim 10000 ppm$ 

Resistance at 1800ppm (isobutane)  $0.68 \sim 6.8 k\Omega$ 

**Sensitivity:**  $0.56 \pm 0.06$  (ratio between the resistance at 3000 and at 1000ppm)

Supply voltage:  $5V \pm 0.2V DC$ Operating temperature:  $-10 \sim +40^{\circ}C$ 

Response time: 30 seconds
Minimum load resistance: 0.45kΩ
Average consumption: 61mA

Figure 36: Image of the TGS2610 sensor

#### 4.12.2. Measurement Process

The TGS2610 is a resistive sensor which shows sensitivity to combustible gases and derivatives. Especially reactive to Isobutane  $(C_4H_{10})$ , it is also sensitive to Methane  $(CH_4)$ , Ethanol  $(CH_3CH_2OH)$  and Hydrogen  $(H_2)$ . Because both its resistance and sensitivity show significant variations between different sensors of the same model, it is recommended to consult the manufacturer's documentation and carry out a process of calibration prior to its final inclusion in an application.

This sensor can be inserted in connectors 2A, 3A and 4, and must be placed in the position indicated in sections "Connector 2", "Connector 3" and "Connector 4". The sensor's output value can be read using the corresponding commands in the SensorGasv20 library:

Reading code:

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENSOR, GAIN, RESISTOR);
   SensorGasv20.setSensorMode(SENS_ON, SENSOR);
   delay(TIME);
   float value;
   value = SensorGasv20.readValue(SENSOR);
}
```

SENSOR indicates the socket into which it is to be inserted, for this sensor:

SENS\_SOCKET2A, SENS\_SOCKET3A or SENS\_SOCKET4A

GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for the sensor

TIME is the time in milliseconds that the sensor remains on before taking the measurement (minimum: 30000)

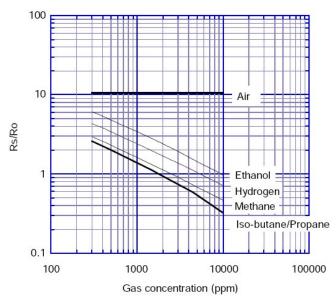

Figure 37: Graph of the sensitivity of the TGS2610 taken from the Figaro sensor's data sheet

-30- v4.1

## 4.13. Air Contaminants Sensor - TGS2600

#### 4.13.1. Specifications

Gases: C<sub>4</sub>H<sub>10</sub>, CH<sub>3</sub>CH<sub>2</sub>OH, H<sub>2</sub>, CO, CH<sub>4</sub> Measurement range: 1 ~ 100ppm

Air resistance:  $10 \sim 90 k\Omega$ 

**Sensitivity:**  $0.3 \sim 0.6$  (ratio between the resistance in 10ppm of H<sub>2</sub> and in air)

Supply voltage:  $5V \pm 0.2V DC$ Operating temperature:  $-10 \sim +40 \degree C$ 

Response time: 30 seconds Minimum load resistance:  $0.45k\Omega$  Average consumption: 46mA

Figure 38: Image of TGS2600 sensor

#### 4.13.2. Measurement Process

The TGS2600 sensor shows sensitivity to the variation of the concentration of numerous gases that are not usually found in the composition of the atmosphere and which are considered contaminants. Amongst these would be mainly, Ethanol ( $\text{CH}_3\text{CH}_2\text{OH}$ ) and Isobutane ( $\text{C}_4\text{H}_{10}$ ) and, with less response, Carbon Monoxide (CO) and Methane ( $\text{CH}_4$ ). This sensor is also sensitive to variations in the concentration of Hydrogen ( $\text{H}_2$ ). The sensor's resistance in air would vary between 10 and 90k $\Omega$ , with a ratio of sensitivity between 0.3 and 0.6 for an  $\text{H}_2$  concentration of 10ppm. Because of this variability it is recommended to calibrate each one of the sensors prior to their use in a final application.

This sensor can be placed on connectors 2A, 3A and 4 following the direction indicated in sections "Connector 2", "Connector 3" and "Connector 4" of this manual. To capture this output voltage value, specific instructions are in the SensorGasv20 library.

Reading code:

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENSOR, GAIN, RESISTOR);
   SensorGasv20.setSensorMode(SENS_ON, SENSOR);
   delay(TIME);
   float value;
   value = SensorGasv20.readValue(SENSOR);
}
```

SENSOR indicates the socket into which it is to be inserted, for this sensor:

SENS SOCKET2A, SENS SOCKET3A or SENS SOCKET4A

GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for the sensor

TIME is the time in milliseconds that the sensor remains on before taking the measurement (minimum: 30000)

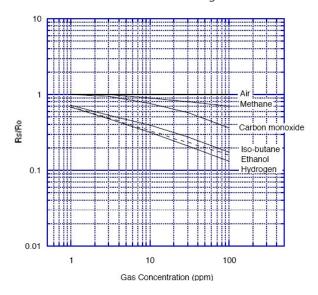

Figure 39: Graph of the sensitivity of the TGS2600 taken from the Figaro sensor's data sheet

-31- v4.1

## 4.14. Air Contaminants Sensor - TGS2602

## 4.14.1. Specifications

**Gases:**  $C_6H_5CH_3$ ,  $H_2S$ ,  $CH_3CH_2OH$ ,  $NH_3$ ,  $H_2$ **Measurement range:**  $1 \sim 30$ ppm **Air resistance:**  $10 \sim 100$ k $\Omega$ 

**Sensitivity:** 0.15 ~ 0.5 (ratio between the resistance in 10ppm of Ethanol and in air)

Supply voltage:  $5V \pm 0.2V$  DC Operating temperature:  $+10 \sim +50$ °C Storage temperature:  $-20 \sim +60$ °C Response time: 30 seconds Minimum load resistance: 0.45k $\Omega$ 

Average consumption: 61mA

Figure 40: Image of the TGS2602 sensor

#### 4.14.2. Measurement Process

The TGS2602 is a sensor similar to the TGS2600 which reacts varying its resistance in the presence of contaminant gases, mainly Toluene ( $C_6H_5CH_3$ ), Hydrogen Sulphide ( $H_2S$ ), Ethanol ( $CH_3CH_2OH$ ), Ammonia ( $NH_3$ ) and to a lesser extent, Hydrogen ( $H_2$ ). In air without contaminants the sensor shows a resistance between 10 and  $100k\Omega$  with a variation ratio between 0.15 and 0.5 between the resistance in 10ppm of  $CH_3CH_2OH$  and this one. This variability makes a calibration of the sensor necessary before using it in a final application.

The TGS2602 sensor can be placed in sockets 2A, 3A and 4 in accordance with the indications shown in sections "Connector 2", "Connector 3" and "Connector 4". The output voltage values of these connectors can be read using the instructions in the SensorGasv20 library:

Reading code:

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENSOR, GAIN, RESISTOR);
   SensorGasv20.setSensorMode(SENS_ON, SENSOR);
   delay(TIME);
   float value;
   value = SensorGasv20.readValue(SENSOR);
}
```

SENSOR indicates the socket into which it is to be inserted, for this sensor:

SENS\_SOCKET2A, SENS\_SOCKET3A or SENS\_SOCKET4A

GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for the sensor

TIME is the time in milliseconds that the sensor remains on before taking the measurement (minimum: 30000)

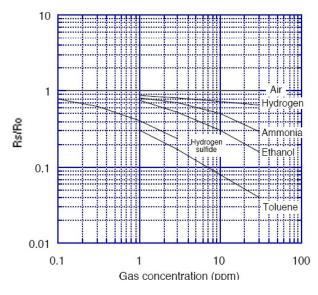

Figure 41: Graph of the sensitivity of the TGS2602 taken from the Figaro sensor's data sheet

-32- v4.1

# 4.15. Solvent Vapors Sensor - TGS2620

## 4.15.1. Specifications

Gases:  $CH_3CH_2OH$ ,  $H_2$ ,  $C_4H_{10}$ , CO,  $CH_4$ Measurement range:  $50 \sim 5000$ ppm Resistance to 300ppm of Ethanol:  $1 \sim 5k\Omega$ 

Sensitivity: 0.3 ~ 0.5 (ratio between the resistance at 300ppm and at 50ppm)

Supply voltage:  $5V \pm 0.2V DC$ Operating temperature:  $-10 \sim +40^{\circ}C$ Response time: 30 seconds

**Load minimum resistance:** 0.45kΩ

**Average consumption:** 46mA (throughout the complete power supply cycle in 250ms)

Figure 42: Image of the TGS2620 Sensor

#### 4.15.2. Measurement Process

The TGS2620 sensor allows detection of alcohol and organic gases, mainly Ethanol ( $CH_3CH_2OH$ ), Hydrogen ( $H_2$ ), Isobutane ( $H_3$ ), Carbon Monoxide (CO) and Methane ( $H_4$ ). The resistance the sensor shows in a 300ppm concentration of Ethanol can vary between 1 and  $H_4$ 0, while the sensitivity ratio between this and the resistance in 50ppm varies between 0.3 and 0.5. As a consequence of these variations it is necessary to calibrate each sensor before their insertion into a final application.

The sensor can be connected to the board through sockets 2A, 3A and 4, provided that their direction is as that shown in sections "Connector 2", "Connector 3" and "Connector 4". The necessary instructions for the reading of the sensor's output is in the SensorGasv20 library.

Reading code:

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENSOR, GAIN, RESISTOR);
   SensorGasv20.setSensorMode(SENS_ON, SENSOR);
   delay(TIME);
   float value;
   value = SensorGasv20.readValue(SENSOR);
}
```

SENSOR indicates the socket into which it is to be inserted, for this sensor:

SENS\_SOCKET2A, SENS\_SOCKET3A or SENS\_SOCKET4A

GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for it

TIME is the time in milliseconds that the sensor remains on before taking the measurement (minimum: 30000)

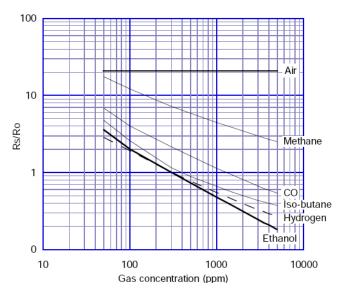

Figure 43: Graph of the sensitivity of the TGS2620 taken from the Figaro sensor's data sheet

# 4.16. Ozone (O<sub>3</sub>) Sensor - MiCS-2610

## 4.16.1. Specifications

Gases: O<sub>3</sub>

Measurement range:  $10 \sim 1000 \text{ppb}$ Air resistance:  $3 \sim 60 \text{k}\Omega$  (typically  $11 \text{k}\Omega$ )

**Sensitivity:** 2 ~ 4 (typically 1.5, ratio between the resistance at 100ppm and at 50ppm)

Supply voltage:  $1.95 \sim 5V DC$ Operating temperature:  $-30 \sim +85 °C$ 

**Response time**: 30 seconds **Average consumption:** 34mA

Figure 44: Image of the MiCS-2610 sensor

#### 4.16.2. Measurement Process

The MiCS-2610 is a resistive sensor that allows to measure the variation of the  $O_3$  concentration between 10ppb and 1000ppb. It's resistance varies between  $11k\Omega$  and  $2M\Omega$  approximately. Unlike the MiCS-2710, this sensor is powered through a 2.5V voltage regulator, with consumption of approximately 34mA. The sensor's resistance in air, as well as its sensitivity, can vary between different units, so it is recommended to calibrate each one of them before finally inserting them in the application.

This sensor must be connected in socket 2B of the board (its position is indicated in section "Connector 2"), and its output can be read through the capture commands of the SensorGasv20 library:

Reading code:

```
{
   SensorGasv20.0N();
   SensorGasv20.configureSensor(SENS_SOCKET2B, GAIN, RESISTOR);
   SensorGasv20.setSensorMode(SENS_ON, SENS_SOCKET2B);
   delay(TIME);
   float value;
   value = SensorGasv20.readValue(SENS_SOCKET2B);
}
```

GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for the sensor

TIME is the time in milliseconds that the sensor remains on before taking the measurement (minimum: 30000)

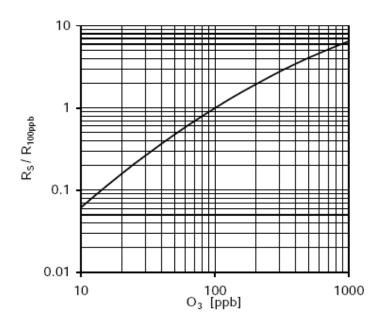

Figure 45: Graph of the sensitivity of the MiCS-2610 taken from the e2v's sensor data

## 4.17. VOC's Sensor - MiCS-5521

## 4.17.1. Specifications

Gases: CO, Hydrocarbons, Volatile Organic Compounds \*

Measurement range:  $30 \sim 400 ppm$ Air resistance:  $100 \sim 1000 k\Omega$ 

Sensitivity: 1.8 ~ 6 (typically 3, ratio between the resistance at 60ppm and at 200ppm of CO)

Supply voltage: 2.1 ~ 5V DC

**Operating temperature:** -30 ~ +85°C

**Response time:** 30 seconds **Average consumption:** 32mA

Figure 46: Image of the MiCS-5521 sensor

#### 4.17.2. Measurement Process

The MiCS-5521 is a resistive sensor that responds to a great variety of gases, such as Carbon Monoxide (CO), Hydrocarbons and Volatile Organic Compounds. It's resistance varies between  $1000k\Omega$  and  $2k\Omega$  approximately. Like the MiCS-2610, the MiCS-5521 is powered through a 2.5V voltage regulator, with consumption of approximately 32mA. The sensor's resistance in air, as well as its sensitivity, can vary between different units, so it is recommended to calibrate each one of them before finally inserting them in the application.

This sensor must be connected in socket 2B of the board (its position is indicated in section "Connector 2"), and its output can be read through the capture commands of the SensorGasv20 library.

Reading code:

```
{
    SensorGasv20.0N();
    SensorGasv20.configureSensor(SENS_SOCKET2B, GAIN, RESISTOR);
    SensorGasv20.setSensorMode(SENS_ON, SENS_SOCKET2B);
    delay(TIME);
    float value;
    value = SensorGasv20.readValue(SENS_SOCKET2B);
}
```

GAIN indicates the chosen gain for the sensor.

RESISTOR indicates the load resistance chosen for the sensor

TIME is the time in milliseconds that the sensor remains on before taking the measurement (minimum: 30000)

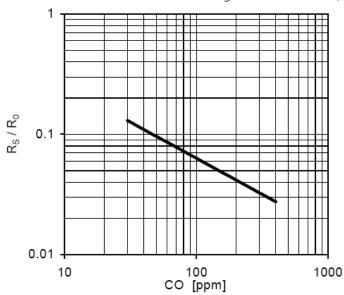

Figure 47: Graph of the sensitivity of the MiCS-5521 taken from the e2v's sensor data

-35- v4.1

# 4.18. Design and connections

The different connectors used for the sensors' connection can be used for the integration of different sensors to those previously planned, provided that the organization of the pins is followed, as well as the defined electrical specifications in the Waspmote manual. In this sense, two types of different sensors are available:

Firstly, the three connectors for analog sensors, initially those for temperature, humidity and atmospheric pressure sensors (see components diagram in section "Hardware. Specifications"). These three connectors have only one strip of three pins which provide connection to ground, to 5V supply and to one of the microprocessor's analog inputs (ANALOG1, ANALOG4 and ANALOG5 respectively). In the case of the humidity and atmospheric pressure sensors' output, a voltage divider of resistances of 3.3K and 2.2K has been placed between these and the microprocessor's analog input ANALOG4 and ANALOG5 to adapt the sensor's output range (between 0 and 4.5V to that available in the Waspmote input (between 0 and 3.3V).

Next the rest of the connectors used for gas sensors are described:

#### 4.18.1. Connector 1

Connector 1 (see the components diagram in section "Hardware. Specifications") has been designed to connect 2 different sensors in the board simultaneously: TGS4161 ( $CO_2$ ) and SK-25 ( $O_2$ ), although its reading and powering is not permitted at the same time. In this way, the connection designed for the  $CO_2$  sensor (which is named connector 1A) has two strips of three 2.54mm pitch female pins, of which two are without connection (the two in the center), one drives the sensor output to the amplification stage, the other the 5V supply controlled by a switch and two are for the circuit's connection to ground; while three isolated pins have been assigned to the  $O_2$  sensor (connector 1B), one connected to ground, another to the sensor's output (accessing the same amplification stage as connector 1A) and another without connections assigned to the sensor's reference pin. The amplification stage of the connectors consists of a voltage follower followed by a non-inverting amplifier, whose gain is controlled through a 100K $\Omega$  digital potentiometer, which can be programmed by the user, up to a maximum value of 101. We can see an image with connector 1A and the connected  $CO_2$  sensor, with reference to the placement highlighted in red, in figure 48.

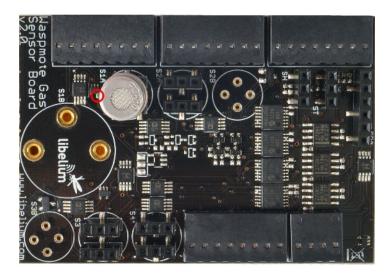

Figure 48: Image of socket 1A with a connected sensor

In the following links you can find two example codes for reading the  $CO_2$  and  $O_2$  sensors, that can be placed in sockets 1A and 1B respectively:

http://www.libelium.com/development/waspmote/examples/ga-4-co2-sensor-reading http://www.libelium.com/development/waspmote/examples/ga-5-o2-sensor-reading

-36- v4.1

#### 4.18.2. Connector 2

As with connector 1, connector 2 (which will be divided into connector 2A and connector 2B) has been designed to support connection of two different sensors at the same time but without allowing simultaneous reading or powering. In this case, the aim of this structure is to allow coexistence on the board of the MiCS-2610 sensor for O<sub>3</sub> and the MiCS-5521 sensor for VOC's (connector 2B) and the TGS2611 resistive sensors for CH<sub>4</sub>, TGS2600 and TGS2602 for air contaminants, TGS2610 for LPG gases and TGS2620 for solvent vapors (connector 2A). The difference between the last sensors and the TGS2442 for CO and TGS2444 for NH<sub>3</sub>, not compatible with this connector, is that the latter require the independent excitation of the heater supply voltage and of the sensor resistance supply voltage. Given that this connector's power is regulated by a single switch, these two last sensors cannot be inserted into this connector without risk of breakdown.

Thus, for connector 2B there are four isolated pins which provide two connections to the 2.5V power (taken from a regulator which receives the 5V power at its input), a connection to ground and another to a load resistance ( $100 \text{K}\Omega$  digital potentiometer) at the input of a non-inverting amplification stage with a maximum gain of 101 controlled through a  $100 \text{K}\Omega$  digital potentiometer. Connector 2A has two strips of 2.54mm pitch female pins which provide the sensor with two connections to 5V supply, controlled by a switch, a connection to ground and another to output, at the same load resistance and amplification stage described previously. The two central pins of both strips, not used, remain without connection. An image of connector 2A can be seen in figure 49 with a connected sensor and its reference for placement highlighted, and an image of connector 2B with a connected  $O_3$  sensor and its reference highlighted can be seen in figure 50.

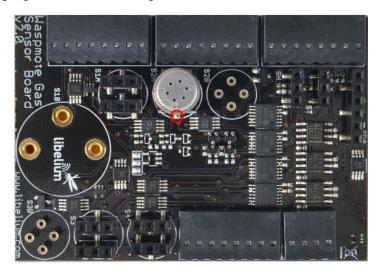

Figure 49: Image of socket 2A with a connected sensor

Figure 50: Image of socket 2B with a connected sensor

In the following links you can find two example codes for reading the sensors placed on sockets 2A and 2B respectively: http://www.libelium.com/development/waspmote/examples/ga-6-socket2a-sensor-reading http://www.libelium.com/development/waspmote/examples/ga-7-socket2b-sensor-reading

-37- v4.1

#### 4.18.3. Connector 3

Connector 3 shows the same structure as connector 2: a socket (3A) composed of two strips of three 2.54mm pitch female pins (whose central pins are not connected to any signal) which provide two connections to 5V power supply and one connection to ground; and a connector (3B) of four pins whose supply voltage is regulated down to 1.8V. Both connectors share the same load resistor, configurable through a  $100k\Omega$  digital potentiometer, followed by an amplification stage with a maximum gain of 101 controlled through another digital potentiometer and whose output is connected to the microcontroller's analog input ANALOG7.

This connector presents two differences respect the former one: first of all, power supply and ground connections in socket 3A are controlled through two switches, activating separately the sensor's heating resistor and the measurement load resistor power circuits, thus allowing to connect sensors TGS2442 for CO and TGS2444 for NH $_3$ , as well as any of the sensors admitted by socket 2A (TGS2611 for CH $_4$ , TGS2600 and TGS2602 for air contaminants, TGS2610 for LPG gases and TGS2620 for solvent vapors). Secondly, connector 3B is endowed with a 1.8V regulator instead of the 2.5V of socket 2B in order to provide connection to the MiCS-2710 sensor for NO $_2$  instead of the MiCS-2610 and MiCS-5521 sensors.

Since three different signals are used to control the activation of the sensors on both 3A and 3B sockets, they can be maintained powered at the same time, though to read the sensor on socket 3A it will be necessary to disconnect briefly sensor MiCS-2710 (this process lasts a few milliseconds and is automatically carried out by the readValue function of the board's API).

In figures 51 and 52 we have two images of both connectors with the sensor's reference pin highlighted.

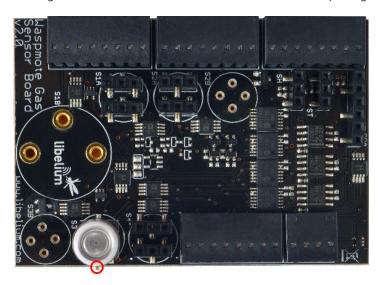

Figure 51: Image of socket 3A with a connected sensor

Figure 52: Image of socket 3B with the MiCS-2710 sensor connected

-38- v4.1

In the following links you can find two example codes for reading the NH<sub>3</sub> sensor placed on socket 3A, the remaining sensors that can be placed on that socket and the NO<sub>3</sub> sensor on socket 3B respectively:

http://www.libelium.com/development/waspmote/examples/ga-12-nh3-sensor-on-socket3-reading http://www.libelium.com/development/waspmote/examples/ga-8-socket3a-sensor-reading http://www.libelium.com/development/waspmote/examples/ga-9-socket3b-sensor-reading

#### 4.18.4. Connector 4

Socket 4 is the only one of those for gas sensors whose adaptation electronics is not shared by two different sockets. It is composed of two strips of three 2.54mm pitch female pins that connect the sensor to power supply, ground and output to a  $100k\Omega$  load variable resistor followed by an amplification stage of maximum gain 101, both controlled by a digital potentiometer. Like connector 3A, power supply circuits for heating and measurement sensor resistances are independently controlled, so the same sensors can be connected (TGS2442 for CO, TGS2444 for NH<sub>3</sub>, TGS2611 for CH<sub>4</sub>, TGS2600 and TGS2602 for air contaminants, TGS2610 for LPG gases and TGS2620 for solvent vapors).

In figure 53 we have an image of a sensor placed on the socket with the reference pin highlighted.

Figure 53: Image of socket 4 with a connected sensor

In the following link you have two example codes for reading the CO sensor on socket 4 and the remaining sensors placed on that sockets respectively:

http://www.libelium.com/development/waspmote/examples/ga-11-co-sensor-on-socket4-reading http://www.libelium.com/development/waspmote/examples/ga-10-socket4-sensor-reading

### 4.18.5. Sockets for casing

In case the Gases 2.0 board is going to be used in an application that requires the use of a casing, such as an outdoors application, a series of sockets to facilitate the connection of the sensors through a probe has been disposed.

These sockets (PTSM from Phoenix Contact) allow to assemble the wires of the probe simply by pressing them into it. To remove the wire press the slot above the input pin and pull off the wire softly.

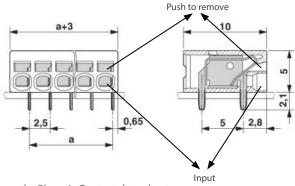

Figure 54: Diagram of a socket extracted from the Phoenix Contact data sheet

-39- v4.1

In the figure below an image of the board with the sockets in it and the correspondence between its inputs and the sensor's pins is shown.

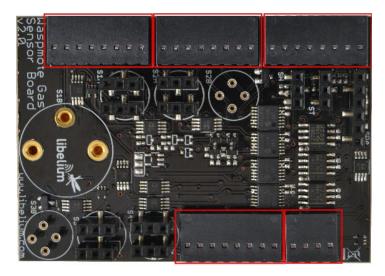

Figure 55: Image of the sockets for casing applications

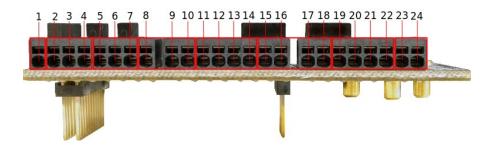

Figure 56: Image of the pin correspondence between the sockets and the sensors

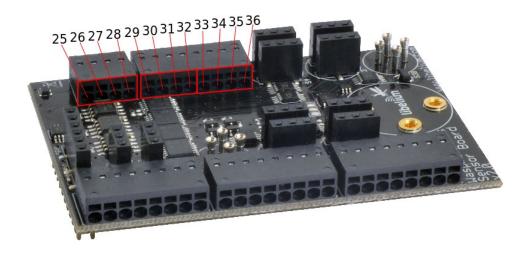

Figure 57: Image of the pin correspondence between the sockets and the sensors

## 5. Board configuration and programming

## 5.1. Hardware configuration

The Gases 2.0 board does not require any handling of the hardware by the user except for placing the sensors in their corresponding position. In the section dedicated to each connector we can see an image of each of the sensors inserted into the corresponding socket with the reference to the sensor's direction highlighted.

### 5.2. API

The Gases 2.0 board for Waspmote has its own library which contains the set of necessary instructions to easily and intuitively configure and read each one of the sensors which connect to the board. Next each one of the functions is described and the process of configuration detailed for each sensor. The specific configuration which must be applied to each one of the sensors is explained in the specific sensor's section.

When using the Gases Sensor Board v20 on Waspmote PRO, remember it is mandatory to include the SensorGasv20 library by introducing the next line at the beginning of the code:

#include <WaspSensorGas v20.h>

Next, the different functions that make up the library are described:

#### SensorGasv20.0N()

Turns on the sensor board by activating the 3.3V and 5V supply lines.

#### SensorGasv20.0FF()

Turns off the sensor board by cutting the 3.3V and 5V supply lines.

#### SensorGasv20.setBoardMode(MODE)

This function is used to switch the sensor board power on and off. The variable MODE can take values SENS\_ON, to switch on the board, and SENS\_OFF, to switch it off.

#### SensorGasv20.configureSensor(SENSOR, GAIN, RESISTOR)

The function described in this section is used to establish parameters which affect taking the sensor's measurements: the socket in which the sensor is connected, the amplification stage gain at the output and the load resistance on which the reading is taken

The value SENSOR indicates the connector on which the sensor has been placed. There are 7 possible connectors to choose, three of which are shared by a number of sensors while the three remaining are exclusive for a specific sensor.

The connectors exclusive to one sensor are:

- SENS CO2, which represents connector 1A, to which only the CO<sub>2</sub> sensor can be connected.
- SENS 02, which represents connector 1B, to which only the O<sub>3</sub> sensor can be connected.
- SENS\_SOCKET3B, which represents connector 3B, to which only the NO<sub>2</sub> sensor can be connected.

The connectors which are shared by a number of sensors are:

- SENS SOCKET2A, which is used for sensors placed in connectors 2A.
- SENS\_SOCKET2B, which is used for sensors placed in connectors 2B.
- SENS\_SOCKET3A, which is used for sensors placed in connector 3, when dealing with the CH<sub>4</sub>, LPG, solvent vapors and both air contaminant sensors.
- SENS SOCKET3C0, which is used when the CO sensor is placed in connector 3.
- SENS\_SOCKET3NH3, which is used when the NH<sub>3</sub> sensor is placed in connector 3.
- SENS\_SOCKET4A, which is used for sensors placed in connector 4, when dealing with the CH<sub>4</sub>, LPG, solvent vapors and both air contaminant sensors.

-42- v4.1

- SENS\_SOCKET4C0, which is used when the CO sensor is placed in connector 4.
- SENS SOCKET4NH3, which is used when the NH, sensor is placed in connector 4.

The variable GAIN represents the gain chosen for the amplification stage which is accessed from the sensor's output. Integer values can be set between 1 and 101.

The variable RESISTOR determines the load resistance on which the sensor acts before the amplification stage, expressed in kiloohms. Values between 0 and  $100k\Omega$  can be taken (provided that the minimum load resistance shown in the specifications of each sensor is respected). In the case of the O<sub>2</sub> and CO<sub>2</sub> sensors, which do not require load resistance, this parameter may be omitted.

#### SensorGasv20.setSensorMode(MODE, SENSOR)

This function, analog to SetBoardMode, allows independent configuration of the power supply of each sensor.

The variable MODE defines the status in which the sensor should be set, which can take the values SENS\_ON, to connect the power, and SENS\_OFF to disconnect it.

The variable SENSOR represents the connector on which the sensor is placed and the type of sensor used, which is able to take the following values:

- SENS\_CO2, to control the CO<sub>2</sub> sensor's power and enable its output.
- SENS\_02 to enable the O<sub>2</sub> sensor's output.
- SENS PRESSURE, to control the atmospheric pressure sensor's power.
- SENS\_SOCKET3B, to control the power of the NO<sub>2</sub> sensor and enable its output.
- SENS\_SOCKET2A, to control the power of the sensor placed in connector 2A and enable its output.
- SENS\_SOCKET2B, to control the power of the sensor placed in connector 2B and enable its output.
- SENS\_SOCKET3A, to control the power of the sensor placed in connector 3 when one of the CH<sub>4</sub>, LPG, solvent vapors and both air contaminants sensors are connected to it (**CAUTION**: do not use this command when the CO or NH<sub>3</sub> sensors are placed in this connector, these sensors must not be permanently powered).
- SENS\_SOCKET4A, to control the power of the sensor placed in connector 4 when one of the CH<sub>4</sub>, LPG, solvent vapors and both air contaminant sensors are connected to it (**CAUTION**: do not use this command when the CO or NH<sub>3</sub> sensors are placed in this connector, these sensors must not be permanently powered).

#### SensorGasv20.readValue(SENSOR)

The function readValue allows capture of the output value of each one of the board's sensors, returning the voltage value in a floating point (float) in the variable to which it has been assigned. The sensor whose output we want to read is defined by the variable SENSOR, which can take the following values:

- SENS TEMPERATURE, for the reading of the temperature sensor.
- SENS\_HUMIDITY, for the reading of the humidity sensor.
- SENS PRESSURE, for the reading of the atmospheric pressure sensor.
- SENS CO2, for the reading of the CO<sub>2</sub> sensor.
- SENS\_02, for the reading of the O<sub>2</sub> sensor.
- SENS SOCKET3B, for the reading of the NO<sub>3</sub> sensor.
- SENS\_SOCKET2A, for the reading of the sensor placed in connector 2A.
- SENS SOCKET2B, for the reading of the sensor placed in connector 2B.
- SENS\_SOCKET3A, for the reading of the sensor placed in connector 3, with the exception of the CO and NH<sub>3</sub> sensors.
- SENS\_SOCKET4A, for the reading of the sensor placed in connector 4, with the exception of the CO and NH<sub>3</sub> sensors.

The values of the variable SENSOR for the reading of the NH<sub>3</sub> and CO sensors are the following:

- SENS SOCKET3CO, to read the CO sensor placed in connector 3.
- SENS SOCKET4CO, to read the CO sensor placed in connector 4.
- SENS\_SOCKET3NH3, to read the NH<sub>3</sub> sensor placed in connector 3.
- SENS SOCKET4NH3, to read the NH $_3$  sensor placed in connector 4.

-43- v4.1

The reason for reading these two sensors in a different way is that they do not normally remain powered, but must be powered by two small pulses of voltage when capturing the output data to avoid them being damaged. The function readValue provides these power supply pulses and automatically reads the sensors when one of the previous values is provided in its input variable.

#### SensorGasv20.calculateResistance(SENSOR, VALUE, GAIN, LOAD)

This function has been implemented to facilitate the calculation of the output of the resistive sensors attached to the board, enabling a direct conversion from the value measured in volts in function of the configuration parameters of the sensor.

The value returned is the resistance of the sensor, expressed in kiloohms, and given in a floating point format. The parameters required by this function are the following:

- SENSOR: Through this parameter the socket upon which the sensor has been placed is specified. It may take the same values than for function readValue.
- VALUE: Here it is introduced the output voltage obtained from function readValue.
- GAIN: This parameter indicates the gain set for the amplification stage. It must be the same value used in function configureSensor.
- LOAD: It refers to the load resistor configured for the sensor voltage divider. It must be the same value used in function configureSensor.

The structure in which the code to read a sensor must be presented is the following:

- 1. The board is switched on using the function **SensorGasv20.0N**.
- $2. Configuration of the sensor's amplification gain and load resistance (the latter if necessary) using the function {\bf SensorGasv20.configureSensor.}\\$
- 3. Turn on the RTC to avoid possible conflicts in the I2C bus using the function RTC.ON.
- 4. The sensor is switched on (with the exception of the CO and NH<sub>3</sub> sensors) using the function **SensorGasv20.** setSensorMode.
- 5. Wait for the necessary amount of time for the sensor's response depending on the accuracy required. The delay function may be used (see the Waspmote API manual).
- 6. Read the sensor using the function **SensorGasv20. readValue**.
- 7. If necessary, switch off the sensors and the board using the functions **SensorGasv20.setSensorMode** and **SensorGasv20.0FF**.

A specific example of the reading of each sensor can be found in the section dedicated to each one.

Below, an example code to read the Air Pollutants 2 sensor (TGS2600) placed on socket 2A is shown

```
/* ------Gases 2.0 Sensor Board example-----
www.Libelium.com
*/

// Inclusion of the Events Sensor Board v20 library
#include <WaspSensorGas_v20.h>

// Inclusion of the Frame library

// Inclusion of the XBee 802.15.4 library
#include <WaspXBee802.h>

// Pointer to an XBee packet structure
packetXBee* packet;

// Heating time
#define TIME 30000
```

-44- v4.1

```
// Load resistor
#define RESISTOR 50
// Gain
#define GAIN 1
float value:
float resistance:
void setup()
  // Switch on the gases sensor board
 SensorGasv20.setBoardMode(SENS ON);
 delay(100);
  // Init RTC
 RTC.ON();
 delay(100);
 SensorGasv20.configureSensor(SENS_SOCKET2A, GAIN, RESISTOR);
 SensorGasv20.setSensorMode(SENS_ON,SENS_SOCKET2A);
 USB.println("Heating Sensor");
 delay(TIME);
void loop()
 value = SensorGasv20.readValue(SENS SOCKET2A);
  resistance = SensorGasv20.calculateResistance(SENS_SOCKET2A, value, GAIN, RESISTOR);
 // Create new frame (ASCII)
 frame.createFrame(ASCII, "Waspmote Pro");
 // Add the value and the resistance calculated read to the frame composition
 frame.addSensor(SENSOR_AP2, value);
 frame.addSensor(SENSOR_STR, resistance);
  // Init XBee
 xbee802.0N();
  // Set parameters to packet:
 packet=(packetXBee*) calloc(1,sizeof(packetXBee));
 packet->mode=BROADCAST;
 // Set destination XBee parameters to packet
 xbee802.setDestinationParams( packet, "000000000000FFFF", frame.buffer, frame.length);
 // Send XBee packet
 xbee802.sendXBee(packet);
 // Turn off the XBee Module
 xbee802.0FF();
 delay(100);
 // Put the mote to sleep with pluviometer interruptions enabled
 PWR.deepSleep("00:00:10:00", RTC_OFFSET, RTC_ALM1_MODE1, UART0_OFF | UART1_OFF | BAT_
OFF);
}
```

The files of the sensor board itself are: WaspSensorGas\_v20.cpp, WaspSensorGas\_v20.h

They can be downloaded from: http://www.libelium.com/development/waspmote/sdk and applications

## 6. Consumption

### 6.1. Power control

On one side, the control of the Gases 2.0 board power can be carried out using the Waspmote's general on/off system for the 3.3V and 5V supply lines, which allows the board to be totally switched on and off (0uA).

On the other hand, specific control mechanisms have been installed inside the sensor board using a system of solid state switches, allowing the independent digital control of each sensor power without the need to physically access the circuit, except for the humidity and temperature sensors, which are powered always the board is on. This way, activation and reading of each sensor can be programmed at the same main code, controlled by the microcontroller. In section "API" where the API libraries related to this board are presented and the use of each of these switches is clearly and precisely described, as well as the correct way to read each sensor.

## 6.2. Consumption table

In the following table the consumption shown by the board when active is detailed, from minimum consumption (constant, fixed by the permanently active components, such as the adaptation electronics and temperature and humidity sensors).

To find out the total consumption of the board with sensors integrated to the consumption of each connector, the consumption of each chosen sensor must be added together. This consumption can be consulted in the section for the sensor itself when all its characteristics are described.

	Switch ON	Switch OFF
Minimum (Constant)	2mA	0mA (Waspmote switch)
Connector 1-A (without sensor)	0mA	0mA
Connector 1-B (without sensor)	0mA	0mA
Connector 2-A (without sensor)	0mA	0mA
Connector 2-B (without sensor)	0mA	0mA
Connector 3-A (without sensor)	0mA	0mA
Connector 3-B (without sensor)	0mA	0mA
Connector 4 (without sensor)	0mA	0mA

## 6.3. Low Consumption Mode

From the point of view of optimizing Waspmote resources when the Gases 2.0 board is used, it is recommended that the following instructions are followed:

#### Keep the board switched off while no measurement is being taken

This is the most efficient method of lowering consumption when none of the parameters are being continually monitored. To completely disconnect the board's power, disable the switches that allow passage of the 3.3V supply, the 5V supply from Waspmote (using the SensorGasv20.setBoardMode library function) and to the two I2C bus channels (SCL and SDA) using the command shown in the WaspmotePWR library (more information on this can be found in the API manual). Do not forget to reconfigure gain and load resistances when switching it on again.

#### Optimize the time the sensors are switched on depending on your application

The accuracy of each sensor's measurement which can be obtained will vary depending on the time that it remains switched on or on the power supply cycles which are continually applied, depending on the type of sensor. Knowing the time required to take a measurement in a determined application will allow saving of consumption without losing resolution in the sampled value.

#### • Simultaneously activate the minimum number of sensors possible

Given that the current allowed in the digital switches' output is limited (about 200mA), it is recommended to not overload them by activating a number of sensors at the same time which in total may surpass this current.

# 7. API Changelog

Function / File	Changelog	Version
#include	Remember to include the WaspSensorGas_v20 library in the top of your pde	v.31 → v1.0
SensorGasv20.0N()	New function to turn on the board	v.31 → v1.0
SensorGasv20.0FF()	New function to turn off the board	v.31 → v1.0
SensorGasv20.calculateResistance	Added the function to calculate the resistance of the sensors from the read voltage and configuration parameters	v.31 → v1.0

-47- v4.1

# 8. Documentation changelog

• Added references to 3G/GPRS Board in section: Radio Interfaces.

## 9. Maintenance

- In this section, the term "Waspmote" encompasses both the Waspmote device itself as well as its modules and sensor boards.
- Take care with the handling of Waspmote, do not drop it, bang it or move it sharply.
- Avoid putting the devices in areas of high temperatures since the electronic components may be damaged.
- The antennas are lightly threaded to the connector; do not force them as this could damage the connectors.
- Do not use any type of paint for the device, which may damage the functioning of the connections and closure mechanisms.

v4.1

-49-

# 10. Disposal and Recycle

- In this section, the term "Waspmote" encompasses both the Waspmote device itself as well as its modules and sensor boards.
- When Waspmote reaches the end of its useful life, it must be taken to a recycling point for electronic equipment.
- The equipment has to be disposed on a selective waste collection system, different to that of urban solid waste. Please, dispose it properly.
- Your distributor will inform you about the most appropriate and environmentally friendly waste process for the used product and its packaging.

-50-
